## **RNMiband Documentation v1.1**

## Libraries that needed for RNMiband:

- 1. react-native-ble-manager
- 2. react-native-crypto
- 3. buffer

## To use RNMiband:

- 1. import RNMiband from '(the path where you put RNMiband.js)'
- 2. Call RNMiband.start({showAlert:false}) in componentDidMount()
- 3. Call RNMiband.handlerUpdate().remove() in componentWillUnmount()

| Core Function       | Description  | Arguments                           | Return (Promise)  |
|---------------------|--|-------------------------------------|---|
| connect(peripheral) | create Bluetooth connection to the given peripheral  | peripheral:<br>peripheral<br>object | the return of Promise means the success of the connection     |
| disconnect()        | disconnect current Bluetooth connection, if nothing connected, then return directly  | N/A                                 | the return of Promise means the success of the connection     |
| getBatteryLevel()   | <ol> <li>Get Miband2 battery level in percentage format.</li> <li>Should only be called if Miband2 is connected</li> </ol> | N/A                                 | Miband2 battery level in string percentage format, e.g., 48%. |

| Core Function                           | Description   | Arguments                              | Return (Promise)  |
|---|---|--|---|
| getStepData()                           | <ol> <li>Get current day's step data, including step count, distance and consumed calories</li> <li>Step data reset everyday</li> <li>Should only be called if Miband2 is connected</li> </ol>  | N/A                                    | Current day's step data, including step count, distance (meter) and consumed calories   |
| getActivityData(startDate)              | 1. Get historical activities data from Miband2 for every minute from the given startDate 2. Should only be called if Miband2 is connected 3. Need to validate the startDate, like make sure it is not after current time  | startDate:<br>Date                     | Historical activities data for every minute from the given startDate.  Format: [[Time1,Kind1,Intensity1,Step1], [Time2,Kind2,Intensity2,Step2],]  Time2 is 1 minute after Time1 |
| getActivityDataRange(startDate,endDate) | 1. Get historical activities data from Miband2 for every minute from the given startDate to the given endDate 2. Should only be called if Miband2 is connected 3. Need to validate startDate and endDate, like make sure they are not after current time, endDate is not before startDate, etc. | startDate:<br>Date<br>endDate:<br>Date | Historical activities data for every minute from the given startDate to the given endDate  Format is the same as above  |

| Core Function | Description   | Arguments | Return (Promise)         |
|---------------|---|-----------|--------------------------|
| findDevice()  | <ol> <li>Looking for lost device</li> <li>Should only be called if Miband2</li> </ol> | N/A       | Miband2 starts vibrating |
|               | is connected  |           |                          |
| foundDevice() | 1. Found device   |           |                          |
|               | 2. Should only be called after  | N/A       | Miband2 stops vibrating  |
|               | findDevice() is called  |           |                          |
